

Aquagenix

A DCS Company

Mosquito Control

Controlling mosquito and midge larvae in your lakes and ponds is one of the most effective methods in managing pesky and dangerous insect populations.

BIOLOGICAL CONTROL

Aquagenix utilizes biological controls and various EPA-approved larvicides that are safe for use in the water.

- When performed on a regular basis, these treatments are very effective in reducing mosquitoes and midges in homeowner areas
- Eliminate all other sources for mosquito breeding including standing water and introducing water features that provide aeration

PEST MANAGEMENT

Our most recommended biological control and most widely used fish in the world for mosquito control is the *Gambusia* fish (commonly known as Mosquitofish), a native and natural predator of mosquitoes and midges.

- Mosquitofish live approximately 2 years and can tolerate a wide variety of temperatures
- These minnow-sized fish are voracious eaters of mosquito and midge larvae, and they will continue to reproduce all
- There are numerous products available to apply for mosquito control, and a variety of application types ranging from granular pellets to liquid

Partner with Aquagenix to create a custom Pest Management Program to control the various stages of mosquito growth in your area.
